

Proofzilla: \LaTeX package for graphical proof theory

Matteo Acclavio

CURRENT VERSION: 0.1 (unofficial release)

“I have never considered drawing as an exercise of particular dexterity, rather as principally a means of expressing intimate feelings and describing states of mind, but a means deliberately simplified so as to give simplicity and spontaneity to the expression which should speak without clumsiness, directly to the mind of the spectator.”

[Henri Matisse]

“Yabadabbadooay, baba! Bootzilla’s here!”

[Bootsy Collins]

To use this \LaTeX package: `\usepackage{proofzilla}`. The package is available at <https://matteoacclavio.com/Math.html?page=research#proofzilla>.

This package requires `tikz` and `txfonts` packages to work.

The package is under development, for any request/feedback/complain write me!

Contents

1	Symbols	2	4.1	Gates, inputs and outputs . . .	6
			4.1.1	Inputs and outputs . . .	6
2	Graphs	2	4.2	Wires	7
2.1	Vertices	2	4.2.1	Labels on wires	7
2.2	Edges	3	4.2.2	Orienting wires	8
			4.2.3	Axioms and Cuts	8
3	Combinatorial proofs	4	4.3	Linear Logic Proof Structures	9
			4.3.1	Jumps	9
4	Interaction nets	6	4.3.2	Boxes	10

All the commands for drawing work using `tikz` functions remembering position and overlay. The commands for vertices and gates create an occurrence of a `tikz` node, and assign it a **nodecode** which identify its occurrence, allowing to refer to it. You can also draw edges between two vertices in the text like this edge \bullet here \bullet .

A suffix `\vertexcode` is attached at the end of each **nodecode**. It is setted to be empty, but some times (if there are too many nodes) it can be useful to redefine it `\def\vertexcode{<newname>}` to avoid that `tikz` mixes **nodecodes**. You can ignore its existence most of the time.

1 Symbols

The following symbols are defined:

$$\begin{array}{llll}
 \ltens = \otimes & \lpar = \wp & \lone = 1 & \lbot = \perp \\
 \lwith = \& & \lplus = \oplus & \ltop = \top & \lzero = 0 \\
 \loc = ! & \wn = ? & \ldia = \diamond & \lbox = \square \\
 \limp = \rightarrow
 \end{array} \tag{1}$$

If some of these commands are already defined by some other command/package, they will not be redefined. Moreover, the package uses the symbols from the package `cmll` if provided.

2 Graphs

To represent graphs, use the environment `array` to have a virtual grid to place vertices on/in it.

2.1 Vertices

The package provides two commands to define two types of vertices as nodes in `tikz`:

- `\newvertex{<name>}{<label>}{<options>}` defines the command

$$\v<name>\{<occurrenceId>\}$$

for fixed-labelled `<label>` vertices/nodes.

- `\newemptyvertex{<name>}{<options>}` defines the command

$$\v<name>\{<occurrenceId>\}\{<label>\}$$

for vertices with label `<label>` can be specified.

Each occurrence of both commands generates a vertex/node with associated **nodecode** `<name><occurrenceId>`. Use `<options>` to provides additional options to the command `node[<options>]`.

Some examples:

$\backslash\text{newvertex}\{\text{name}\}\{\text{label}\}\{\}$ $\backslash\text{newvertex}\{\text{square}\}\{\text{sq}\}\{\text{draw},\text{circle}\}$ $\backslash\text{newemptyvertex}\{\text{module}\}\{\text{draw}\}$	$\backslash\text{vname1} = \text{label}$ $\backslash\text{vsquare1} = \text{sq}$ $\backslash\text{vmodule1}\{\text{foo}\} = \text{foo}$
---	---

The labels of graph vertices are defined in $\$math\$$ environment.

2.2 Edges

The package provides a command to define edges styles.

$$\backslash\text{defedgetype}\{\langle\text{name}\rangle\}\{\langle\text{draw options}\rangle\}\{\langle\text{to options}\rangle\}$$

To understand the options, think that the edges of that type are drawn in tikz using

$$\backslash\text{draw}[\langle\text{draw options}\rangle] (\langle\text{source}\rangle) \text{ to } [\langle\text{to options}\rangle] (\langle\text{target}\rangle)$$

Each call of $\backslash\text{defedgetype}$ defines the following commands:

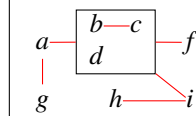

- $\backslash\langle\text{name}\rangle\text{edge}\{\langle\text{source}\rangle\}\{\langle\text{target}\rangle\}$ draws an edge of type $\langle\text{name}\rangle$ from node with **nodecode** $\langle\text{source}\rangle$ to node with **nodecode** $\langle\text{target}\rangle$;
- $\backslash\langle\text{name}\rangle\text{edges}\{\langle\text{list}\rangle\}$ draws an edge of type $\langle\text{name}\rangle$ for each pair of the list $\langle\text{list}\rangle$ in the form $\{\text{source}/\text{target}, \dots\}$ from each source to each target;
- $\backslash\text{multi}\langle\text{name}\rangle\text{edge}\{\langle\text{list1}\rangle\}\{\langle\text{list2}\rangle\}$ draws an edge of type $\langle\text{name}\rangle$ from each node in $\langle\text{list1}\rangle$ to each node in $\langle\text{list2}\rangle$.
- $\backslash\text{bent}\langle\text{name}\rangle\text{edges}\{\langle\text{list}\rangle\}$ draws an edge of type $\langle\text{name}\rangle$ for each triple of the list $\langle\text{list}\rangle$ in the form $\{\text{source1}/\text{target1}/\text{bendvalue1}, \dots\}$ from each source each target with the corresponding `bend left` value;
- $\backslash\text{spec}\langle\text{name}\rangle\text{edge}\{\langle\text{source}\rangle\}\{\langle\text{target}\rangle\}\{\langle\text{to options}\rangle\}$ draws an edge of type $\langle\text{name}\rangle$ from from node with **nodecode** $\langle\text{source}\rangle$ to node with **nodecode** $\langle\text{target}\rangle$ with additional to $[\langle\text{to options}\rangle]$ options ... Just because some time you need a special edge;
- $\backslash\langle\text{name}\rangle\text{ledge}\{\langle\text{source}\rangle\}\{\langle\text{target}\rangle\}\{\langle\text{label}\rangle\}$ draws an edge of type $\langle\text{name}\rangle$ from node with **nodecode** $\langle\text{source}\rangle$ to node with **nodecode** $\langle\text{target}\rangle$ with a label $\langle\text{label}\rangle$ (midway).
- $\backslash\langle\text{name}\rangle\text{ledges}\{\langle\text{list}\rangle\}$ draws a labelled edge of type $\langle\text{name}\rangle$ for each tripe in the list $\langle\text{list}\rangle$ in the form $\{\text{source}/\text{target}/\text{label}, \dots\}$;
- $\backslash\langle\text{name}\rangle\text{sameledges}\{\langle\text{list}\rangle\}\{\langle\text{label}\rangle\}$ draws a labelled edge of type $\langle\text{name}\rangle$ for each pair in the list $\langle\text{list}\rangle$ in the form $\{\text{source}/\text{target}, \dots\}$; all with the same label $\langle\text{label}\rangle$;

- `\spec<name>ledge{<source>}{<target>}{<to options>}{<label>}` draws a labelled edge of type `<name>` from node with **nodecode** `<source>` to node with **nodecode** `<target>` with additional to `[<to options>]` options and label `<label>`.

```

\begin{array}{ccc} \va1 & & \\ \vM1{\begin{array}{cc}\vb1&\vc1\\\vd1\end{array}} & & \\ & \&\vf1\[[1em] \vg1 &\vh1 &\vi1 \end{array} & & \\ \testedges{a1/M1,M1/f1,b1/c1,g1/a1,i1/h1,i1/M1} & & 

```

Moreover, `\defedgetype` also define the following commands for edges with a `<label>` marked in the midway of the edge

- `<name>ledge{<source>}{<target>}{<label>}` draws an edge of type `<name>` from **nodecode** `<source>` to `<target>` with label `<label>`;
- `<name>ledges{<list>}` draws a labelled edge for each triple of the list `<list>` in the form `{source/target/label, ...}`;
- `<name>sameedges{<list>}{<label>}` draws a labelled edge for each pair of the list `<list>` in the form `{source/target, ...}`, all with the same label `<label>`;
- `\spec<name>ledge{<source>}{<target>}{<to options>}{<label>}` same as `\spec<name>edge` but with an additional argument for the label.

$$a \text{---} \textit{label} \text{---} b$$

3 Combinatorial proofs

The package provides the definition of logic negation `\cneg<arg>` as `\bar<arg>` if not already defined.

The following commands for vertices are pre-defined using `\newvertex`: atomic variables, i.e. are lowercase alphabetic letters `\va#1... \vz#1`, with their negation `\vna#1... \vnz#1` and the following ones¹

$$\begin{array}{llll}
\vlone#1 = 1 & \vlbot#1 = \perp & \vltop#1 = \top & \vlzero#1 = 0 \\
\voc#1 = ! & \vwn#1 = ? & \vlbox#1 = \square & \vldia#1 = \diamond \\
\vjump#1 = \circ & & &
\end{array}$$

Their **nodecode** is given by removing the letter `v` from the command name, e.g., the **nodecode** of the vertex `\vlbot7` is `lbot7`.

¹Note that redefining commands in Equation (1) will change labels accordingly.

The following standard edge types for combinatorial proofs are provided:

D or dirgraph	=	$\bullet \longrightarrow \bullet$	G or graph	=	$\bullet \text{---} \bullet$
DR or dircograph	=	$\bullet \xrightarrow{\text{red}} \bullet$	R or cograph	=	$\bullet \text{---} \bullet$
A or arena	=	$\bullet \xrightarrow{\text{red}} \bullet$			
M or mod	=	$\bullet \xrightarrow{\text{wavy}} \bullet$	L or link	=	$\bullet \text{---} \bullet$
S or skew	=	$\bullet \xrightarrow{\text{dotted}} \bullet$	B or matching	=	$\bullet \text{---} \bullet$
doubleS	=	$\bullet \xrightarrow{\text{dotted}} \bullet$	doubleB	=	$\bullet \text{---} \bullet$

The command `\cutshade<south-west><north-east>` draws a shaded (in grey) rectangle with south-west corner the vertex `<south-west>` and north-east corner the vertex `<north-east>`. The command `\vhid#1` is provided for a vertex with no labels and with **nodecode** `hid#1`. It can be used in case there are no vertices in the corners of the desired cutshade.

```

\begin{array}{ccccccc}
\vb1&&\vb0&&\va1&&\va0& \\
\voc1&&\vwn1&&\voc2&&\vwn2& \\
&&&&\va3&&\va2& \\
((\vb5&\limp&\vb4&)\limp&\va7& \\
\limp&(\va4&\land&\va6& \\
\end{array}
\Bedges{a1/na1,a2/na2}
\dmatchingedges{oc1/wn1,wn2/oc2}
\multiRedges{na1,wn1}{a2,oc2}
\Medges{oc1/a1,wn1/na1,oc2/a2,wn2/na2}
\Sedges{a1/a3,na1/na3,a2/a2,na2/na4}
\Aedges{b1/b0,b0/a1}
\multiAedges{a1,a3}{a0,a2}
\Sedges{b1/b5,b0/b4,a1/a7,a3/a7,a0/a4,a2/a6}
\bentLedges{a2/a3/20,a1/a0/20,b1/b0/20}

```

Figure 2: A combinatorial proof with cuts

4 Interaction nets

As for graphs, use the environment array to have a virtual grid to place gates on/in it.

4.1 Gates, inputs and outputs

The package provides a command to define proof structures gates:

```
\newgate{<name>}{<label>}{<options>}
```

Each command provides the following commands to draw gates (where <label>= X):

command	nodecode	node representation
<code>\G<name>{<occId>}</code>	<code>G<name><occId></code>	
<code>\uG<name>{<occId>}</code>	<code>uG<name><occId></code>	
<code>\lG<name>{<occId>}</code>	<code>lG<name><occId></code>	
<code>\rG<name>{<occId>}</code>	<code>rG<name><occId></code>	

Gates have the `isosceles` triangle's anchors plus the following:

4.1.1 Inputs and outputs

The package also provides commands to define input/outputs or floating labels

```
\psnode[<optional-label>]{<occurrenceId>}
\psanode[<optional-label>]{<occurrenceId>}
\pslnode{<label>}{<occurrenceId>}
\pshang{<occurrenceId>}
```

which respectively produce nodes with **nodecodes** `node<optional-label><occurrenceId>`, `node<optional-label><occurrenceId>`, `node<occurrenceId>`, and `hang<occurrenceId>`. To remember the commands: *a* stands for *anonym* and *l* stands for *labelled*.

command	nodecode	node representation
<code>\psnode[a]2</code>	nodea2	a
<code>\psnode 1</code>	node1	
<code>\pslnode a 2</code>	nodea2	a
<code>\psanode[a]2</code>	node2	a
<code>\psanode 3</code>	node3	
<code>\pshang 1</code>	hang1	\circ

Nodes generated by these commands have standard rectangle anchors plus I (north) and O (south) and C (center).

The following commands for gates provided:

$$\begin{array}{ll}
 \backslash\text{GDup}\#1 = \triangle_{\theta} & \backslash\text{Gdup}\#1 = \blacktriangledown \\
 \backslash\text{GEr}\#1 = \textcircled{\epsilon} & \backslash\text{Ger}\#1 = \bullet \\
 \backslash\text{uGDup}\#1 = \triangle_{\theta} & \backslash\text{uGdup}\#1 = \blacktriangle
 \end{array}$$

4.2 Wires

The package provides a command to draw a wires:

- `\pswire{<source>}{<target>}{<looseness>}` draws a single (unlabelled) wire from an input to an output;
- `\pslwire{<source>}{<target>}{<looseness>}{<label>}` draws a single labelled wire;
- `\pswires{<list>}` draws wires from a list $\{\text{element}, \dots\}$ of with elements of form source/target or source/target/label;
- `\psbentwires{<list>}` draws wires with specified looseness for a list with elements of either forms

source/target/looseness or source/target/label/looseness

If only the **nodecode** of a gate is given, then the wire come out/in from its center anchor. Use the anchors in Equation (2) to specify where the wire is attached, e.g., `G<name><occurrence>.<anchor>`.

Wires comes in and out of a gate at an angle of respectively 90 and -90 degree (`\topdownps`). If proof structures are represented horizontally (from left to right), you can change these angle to respectively 180 and 0 degree using the command `\lefttorightps`.

4.2.1 Labels on wires

Wires labels are in $\$math\$$ environment. By default `\pswiresdecfalse`, that is, wires are unlabelled. It is possible to reveal/hide wires label respectively using `\pswiresdectrue` and `\pswiresdecfalse`.

4.2.2 Orienting wires

By default proof structure wires are non-oriented. Use the commands `\psdirectedwires` and `\psundirectedwires` to respectively enable and disable wires orientation.

Additional commands to draw wires arrow tip in a specific position are provided.

- `\pswire{<source>}{<target>}{<looseness>}{<tipAt>}` draws a wire from `<source>` to `<target>` with a given `<looseness>` and arrow tip in position `<tipAt>`;
- `\pswires{<list>}` draws wires from a list `{element, ...}` of with elements of form `source/target/looseness/tip-position`.

These commands do not support wire labels.

4.2.3 Axioms and Cuts

The package provides the following commands to draw for axioms:

- `\psaxiom{<target1>}{<target2>}{<looseness>}` draws a wire from the gate with **nodecode** `<target1>` to node with **nodecode** `<target2>` with looseness value `<looseness>`;
- `\psaxioms{<list>}` draws an axiom for each pair of the list `<list>` of the form `{target1/target2, ...}`;
- `\psbentaxioms{<list>}` draws an axiom with given looseness for each triple of the list `<list>` in the form `{target1/target2/looseness, ...}`.

Similar commands are defined for cuts.

```
\pscut{<target1>}{<target2>}{<looseness>}
\pscuts{<list>}
\psbentcuts{<list>}
```

By default proof structures are represented in interaction nets syntax, that is, axioms and cuts are wires. It is possible to enable the explicit representations of axioms using `\interactionnetaxtrue` and cuts using `\interactionnetcuttrue`.

The labels for axiom and cut gates are respectively `ax` and `cut`. It is possible change these labels using `\changeaxsymbol<newsymbol>` and `\changecursymbol<newsymbol>`.

4.3 Linear Logic Proof Structures

The following commands for gates for standard connectives are provided:

<code>\Gtens#1</code> = 	<code>\Gpar#1</code> = 	<code>\Gwith#1</code> = 	<code>\Gplus#1</code> = 
<code>\GwnD#1</code> = 	<code>\GwnW#1</code> = 	<code>\GwnC#1</code> = 	<code>\Gwnwn#1</code> = 
<code>\GocD#1</code> = 	<code>\GocW#1</code> = 	<code>\GocC#1</code> = 	<code>\Gococ#1</code> = 
<code>\Gone#1</code> = 	<code>\Gbot#1</code> = 	<code>\Gtop#1</code> = 	<code>\Gzero#1</code> = 
<code>\uGtens#1</code> = 	<code>\uGpar#1</code> = 	<code>\uGwith#1</code> = 	<code>\uGplus#1</code> = 
<code>\uGwnD#1</code> = 	<code>\uGwnW#1</code> = 	<code>\uGwnC#1</code> = 	<code>\uGwnwn#1</code> = 
<code>\uGocD#1</code> = 	<code>\uGocW#1</code> = 	<code>\uGocC#1</code> = 	<code>\uGococ#1</code> = 

Plus the following `!` and `?` generic gates

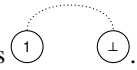

<code>\Goc#1</code> = 	<code>\Gwn#1</code> = 	<code>\uGoc#1</code> = 	<code>\uGwn#1</code> = 
---	---	--	--

4.3.1 Jumps

The package provides the following command to draw jump edges (similar to the ones for axioms/cuts):

- `\psjump{<target1>}{<target2>}{<looseness>}` draws a jump edge between `<target1>` and `<target2>` with given `<looseness>`;

- `\psjumps{<list>}` draws a jump edge for each pair in the `<list>` of the form `{taget1/target2,...}`
- `\psbentjumps{<list>}` draws a jump edge for each triple in the `<list>` of the form `{taget1/target2/looseness,...}`

For example `\Gone1\quad\Gbot1\psjump{Gone1.I}{Gbot1.I}` gives . It is possible to change the style of jumps wires using the command

```
\changejumpstyle{<tikz options>}
```

4.3.2 Boxes

Linear logic boxes are defined by positioning two vertices `\boxYin{<boxId>}` and `\boxYang{<boxId>}` and then calling the command

```
\psBox[<orientation>]{<boxId>}{<principalanchor>}{<list>}
```

which draws a box as follows:

- it draws a rectangle with corner `\boxYin{<boxId>}` and `\boxYang{<boxId>}`;
- it place an `!-`gate with **nodecode** `box<boxId>main` at the anchor `<principalanchor>` of the rectangle. If `<orientation>` is not given or if it is `D`, the gate points downwards, if it is `U` the gate points upwards.
- for each `<anchor>` in `<list>`, it draws an auxiliary port, that is a `psnode`, on the anchor `<anchor>`. Each auxiliary port has **nodecode** `\box<boxId>aux<anchor>`.

```
\begin{array}{ccccc}
\boxYin1\ \\
&\pslnode a1&\mbox{box content}&&\ [.5em] \\
&&&\boxYang1\ \\ \ [.1em] \\
\pslnode b1 && \pslnode c1\end{array} \\
\psBox{1}{-60}{-155,60,120} \\
\pswires{nodea1/box1aux-155,box1aux-155/nodec1} \\
\psbentwires{box1main.0/nodeb1/.6}
```

Acknowledgements

Thanks to Lutz Straßbourger to have shared his macros for vertices and edges from which the package has evolved to the current shape.
